

ABSTRACT

A device for recording dream recollections is provided. Embodiments of the device encompass an audio recording and storage means for recording, storing, replaying and otherwise manipulating one or more audio files. Such embodiments provide a person the ability to conveniently record dream recollections by speaking such recollections aloud after activating the device. Embodiments of the device can sit on a table proximate a bed, or be attached to a wall, bedpost, or headboard in a removable or fixed manner. Activation of such embodiments of the device can be via an activation means that is configured to be readily located in the dark or low ambient light conditions. Some embodiments of the present invention are coupled to other devices such as a timing device such as clock or clock radio, where such timing device can provide automatic activation.
